Alprazolam is a prescription medication belonging to the benzodiazepine class. Healthcare providers commonly prescribe it for the treatment of:

- Generalized Anxiety Disorder (GAD)
- Panic Disorder
- Anxiety associated with depression
- Short-term management of severe anxiety symptoms

Alprazolam works by enhancing the activity of gamma-aminobutyric acid (GABA), a neurotransmitter that helps calm excessive brain activity.

Important: Alprazolam should only be taken under the supervision of a licensed healthcare provider. It carries risks of dependence, tolerance, and withdrawal if misused.
